

Project Title

Quality Improvement in Lost Specimen Metric through Process Improvements and Automated Process Optimisation: A Retrospective Analysis

Project Lead and Members

- Amarasinghe Arachchige Don Nalin Samandika Saparamadu
- En Xin Foo
- Noel Wan Ting Ong
- Andrew Goh
- Choong Weng Leslie Lam

Organisation(s) Involved

Doctor Anywhere Pte Ltd, Ng Teng Fong General Hospital, Parkway Laboratory Services Ltd

Healthcare Family Group Involved in this Project

Medical, Nursing, Allied Health

Specialty or Discipline

Medical & Laboratory Technology

Project Period

Start date: Apr 2016

Completed date: Dec 2018

Aims

To evaluate the effectiveness of proactive quality improvement efforts related to lost specimen metrics based on our experience at a tertiary care clinical laboratory in Singapore

Background

Introduction

Pre-analytical errors comprise 44-61.9 percent of all laboratory errors that occur in the total testing process [1]. Lost specimens are a form of pre-analytical error that could occur at any point upon specimen collection and can result in poor patient outcomes [2].

The lost specimen metric has been identified as a pre-analytic quality measure in clinical laboratories despite the sparse literature quantifying the problem and assessing mitigation efforts. A Six-Sigma approach has been employed to analyse laboratory lost specimen metrics in the literature [2,3].

Results

All QI interventions were categorised into a) automation and automated process optimisation, and b) managing human behaviour through process improvements (Table1).

Automation and automated process optimisation

1. Nov 2016: Corrective maintenance on clinical

Managing human behaviour through process improvements

1. April 2016: Workbench de-cluttering using 5S

Upon operationalisation, our laboratory initiated proactive quality improvement (QI) measures to evaluate and intervene to reduce lost specimen rates. In this poster, we present the approach and results of a retrospective analysis of QI measures.

Aim

To evaluate the effectiveness of proactive QI efforts related to lost specimen metrics based on our experience at a tertiary care clinical laboratory in Singapore.

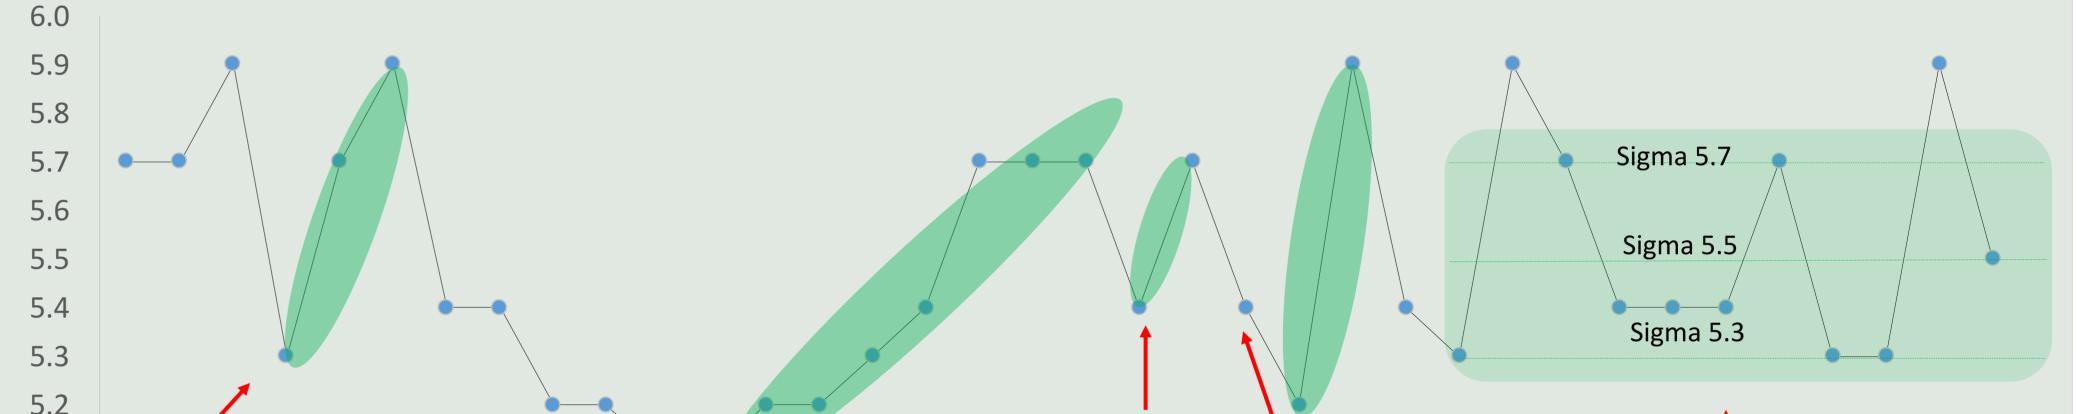

Methodology

- chemistry automation track.
- 2. Jan 2017: Introducing a banner on Epic System to enhance visibility upon specimen receipt.
- 3. Aug 2017: Replacing slider on PTS (Phase 1).
- 4. Aug 2017: Replacing PTS velco (Phase 1).
- 5. Oct 2017: Replacing slider on PTS (Phase 2).
- 6. Oct 2017: Replacing PTS velco (Phase 2).
- productivity improvement tool.
- 2. Sep 2016: Introducing lost specimen checklist.
- 3. Oct 2016: Retraining for specimen reception staff.
- 4. Jan 2017: Training nurses for proper use of PTS.
- 5. Jan 2017: Revising checklist to expand areas for manual searches.

Table 1: The classification of QI interventions in a chronological order.

We observed positive and stable trends in Six-Sigma levels of the lost specimen metric over the last 12 months of the study period, demonstrating levels of 5.3-5.9 with an average of 5.5. This overall positive trend is likely achieved as a cumulative result of the interventions.

- This retrospective analysis was \bullet conducted at a tertiary care clinical laboratory in Singapore from 01 Jan **2016 to 31 December 2018 – a** period of three years.
- For the purpose of this analysis, a \bullet lost specimen was defined as a

"specimen that is reported to have been misplaced and undiscoverable for analysis upon a comprehensive search conducted according to current workflow and checklists within a period of 24 hours from the time of dispatch."

- Laboratory lost specimen data were \bullet collected systematically and examined/investigated using methods for root cause analysis (RCA) by the Incident Management Committee.
- Patterns identified and the insights \bullet generated by RCA were used in planning interventions based on published evidence and professional expertise. Interventions were analysed and categorised into domains.
- Frequency of lost specimens was

5.1 5.0 4.9 4.8 4.7 4.6 4.5 4.5 4.4 4.3 4.2 4.1 4.1 4.0	April 2016: 1. Workbench de-cluttering using 5S quality improvement tool	Sep 2016: 2. Implement lost specimen checklist Oct 2016: 3. Retraining for specimen reception staff	<section-header></section-header>	Jan 2017: 5. Train nurse proper use of PTS Jan 2017: 6. Revise checklist to expand areas for searches Jan 2017: 7.Add "banner" on Epic to enhance visibility upon sample receipt	Aug 2017: 8. Replaced slider on PTS (Phase 1) Aug 2017: 9. Replaced PTS velco (Phase 1)	Oct 2017: 10. Replaced slider on PTS (Phase 2) Oct 2017: 11. Replaced PTS velco (Phase 2) (Phase 2)	Jan 2018 to Dec 2018 No intervention during this period. Sigma was maintained above 5.3 with average of 5.5 over 12 months.
Jan-16 Mar-16 May-16 Jul-16 Sep-16 Nov-16 Jan-17 Mar-17 May-17 Jul-17 Sep-17 Nov-17 Jan-18 Mar-18 May-18 Jul-18 Sep-18 Nov-18 Study period (mmm-yy)							

Figure 1: Monthly lost specimens per million tests performed and interventions implemented during the 3-year study period.

Based on our analysis, workbench de-cluttering using the 5S* method was observed as a possible standalone high-impact intervention. Furthermore, introducing a checklist, retraining laboratory staff to familiarise themselves with after-hours storage, and training for nursing staff regarding pneumatic tube system (PTS) canisters also displayed positive outcomes. Interventions targeting human behaviour appear to yield better results than automated process optimisation (Figure 1).

Conclusion

This retrospective analysis demonstrates the utility of proactive QI in a newly established clinical laboratory. We observed that the overall influence of these activities is compounding, with each building on the success of the last. Proactive QI accompanied by evidence-informed targeted interventions and its regular maintenance should be considered to address the burden of lost specimens. Furthermore, automated process improvements and behavioural controls are instrumental in addressing lost specimen metrics. An important limitation of this analysis is the absence of an experimental design due to pragmatic concerns. Further longitudinal and experimental studies are necessary to assess the effectiveness of individual interventions.

expressed in Six-Sigma performance levels using the Westgard Six-Sigma calculator on a monthly basis. Six-Sigma performance is understood as ≤ 3.4 defects per million opportunities (DPMO) or 99.99966% defect-free work [2].

Acknowledgements

Authors would like to acknowledge the contributions of Ms Voon Hwi Lee and Dr Renyuan Li in data collection and administrative tasks. Furthermore, we acknowledge the contributions of Ms Joanne Lee in data analysis, Dr Albie Sharpe (Public Health) in reviewing the abstract, and Ms Shannon Salgadoe (Public Health and Primary Care Research Project) in preparing the poster presentation.
