#### Organisation(s) Involved

Assisi Hospice, Singapore University of Technology and Design, National Cancer Centre Singapore

#### Healthcare Family Group(s) Involved in this Project

Allied Health

#### **Applicable Specialty or Discipline**

Palliative Care

#### Aim(s)

Aim to reduce feeding related errors in our inpatient service to less than 15 in each feeding observation domain (FOD)

#### Background

See poster appended/below

#### Methods

See poster appended/ below

CENTRE FOR HEALTHCARE INNOVATION.

#### Results

See poster appended/ below

#### **Lessons Learnt**

This project allowed the team to work with different stakeholders to improve on dysphagia management in Assisi Hospice. With the buy in of staff, we were able to successfully implement various measures to reduce feeding related errors and adverse outcomes, hence improving the quality of life of our palliative care patients. Regular meetings with ground staff, ongoing education and working towards a common goal were key factors contributing to the success of this project.

#### Conclusion

See poster appended/ below

#### **Additional Information**

Community Care Excellence Awards 2022: Clinical Quality Gold Award

#### **Project Category**

Care & Process Redesign

Quality Improvement, Workflow Redesign, Clinical Practice Improvement, Lean Methodology

#### **Keywords**

Standardization, Dysphagia Management, Ishikawa Diagram

<sup>1</sup>Assisi Hospice, Singapore, <sup>2</sup>Singapore University of Technology and Design, <sup>3</sup>Division of Supportive and Palliative Care, National Cancer Centre, Singapore

### **BACKGROUND AND MISSION STATEMENT**

Dysphagia occurs in up to 79% of palliative care patients and adversely affects quality of life and health outcomes<sup>1</sup>. Tan et. al reported a 57% compliance rate with prescribed dysphagia management in their inpatient hospice<sup>2</sup>. Assisi Hospice is an 85-bedded inpatient service, caring for patients with a life-limiting illness and a likely prognosis of 3 months or less. This quality improvement project aims to reduce feeding-related errors in our inpatient service to less than 15% in each feeding observation domain (FOD).

### **ANALYSIS OF PROBLEM**

A baseline FOD audit of 63 patients was conducted from 13-24 July 2020. Data collected included diet and fluid served, respective utensils used and headboard information. Discrepancies were noted in 52 (82.5%) headboards, 19 (30.5%) diets and 13 (20.6%) fluids served; and 14 (22.0%) patients were served using the wrong utensils for fluids. (Fig. 1)

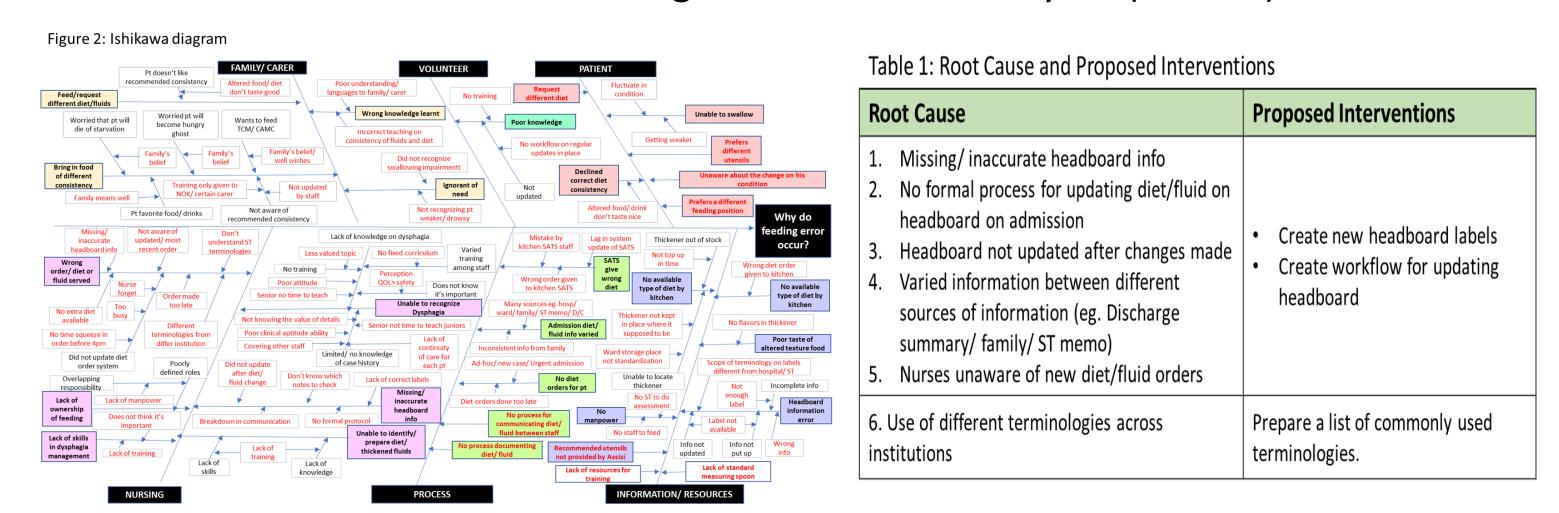

Inpatient nurses were invited to participate in an online survey in February 2021 to understand the current practices of feeding and knowledge of the meal ordering system (MOS). Seventy-five out of 102 nurses completed the survey which showed that there was currently no standardisation of meal ordering amongst nurses.

### **METHOD**

Table 2: Project timeline

An Ishikawa diagram was used to determine the root causes of feeding-related errors. (Fig. 2) Multi-voting was conducted between team members and the top root causes were identified following a Pareto Chart analysis. (Table 1)

# STRATEGY FOR CHANGE & MEASUREMENT FOR IMPROVEMENT

Standardised headboard labels and workflow for updating diet/fluid headboard information were created and commenced in February 2021. A workgroup with ward champions was created on 5 March 2021. Workflows for meal ordering pertaining to planned admissions from hospital, home and urgent admissions were created and implemented on 19 April 2021. (See Table 2)

Monthly audits for concurrence between headboard information, prescribed diet/fluid and diet/fluid served were conducted from June. Documentation of relevant diet and fluid information on referral, nursing handover and patient transfer forms was audited from 7-11 June 2021. Results of the monthly data are shown in Table 3 and Figure 3.

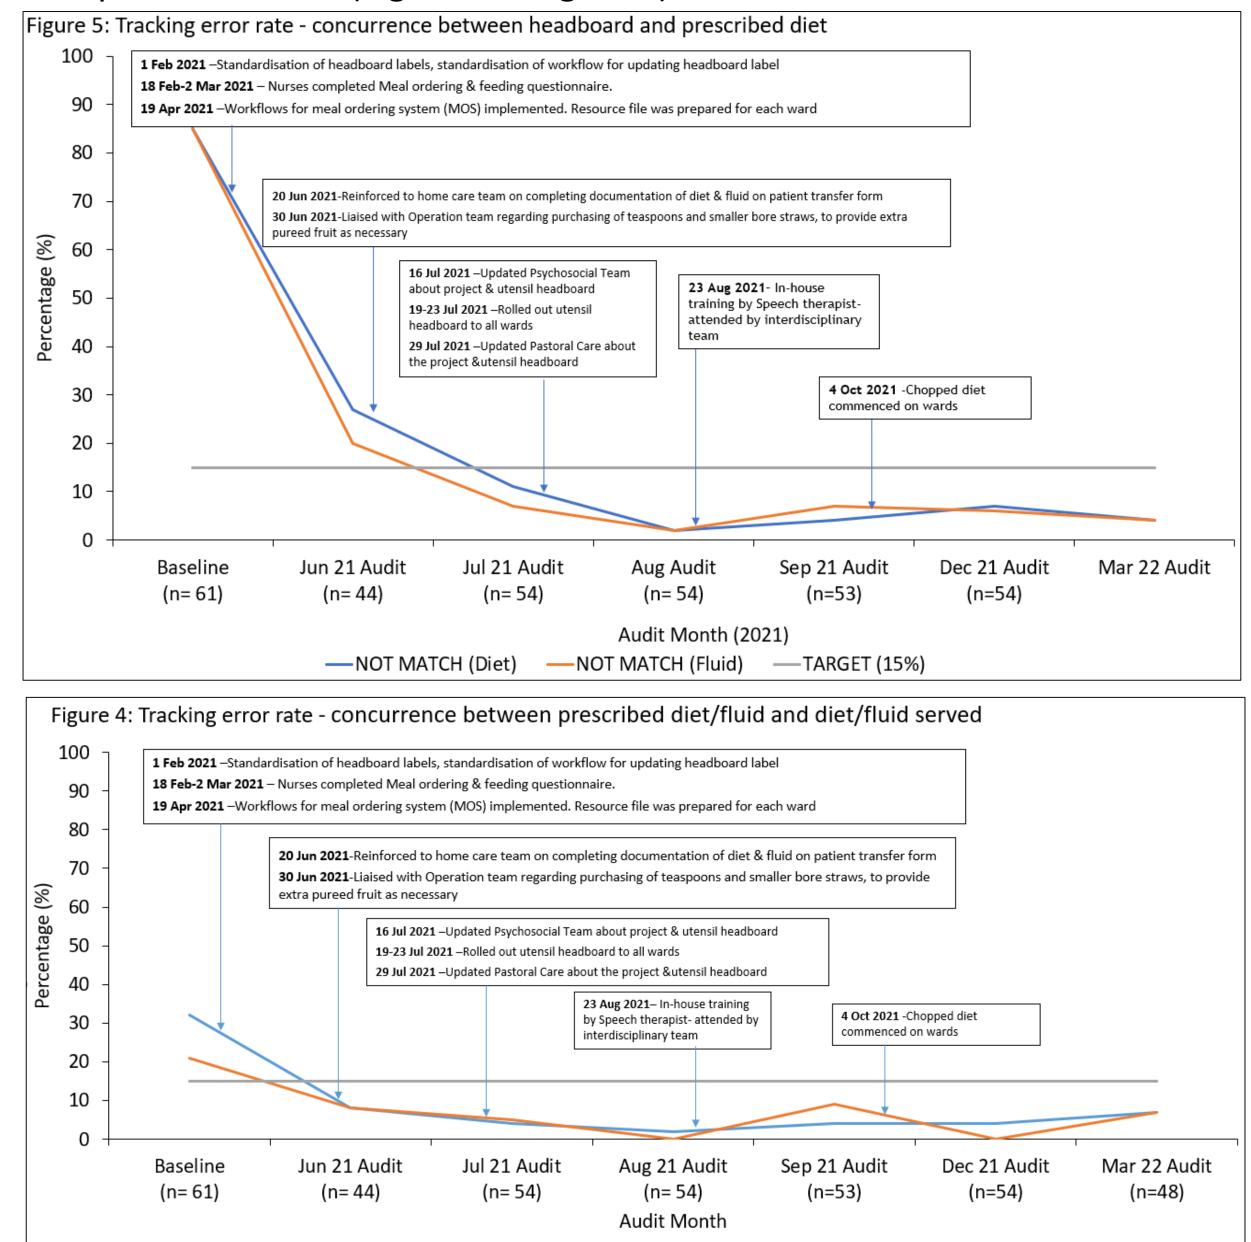

### **DISCUSSION**

Following the implementation of the new headboard labels and workflows for MOS, accuracy of headboard diet and fluid information improved from 15% to more than 70% in the first audit in June, and further improved to 80% or more in the subsequent audits. Documentation of pre-admission diet and fluid improved with increased awareness of dysphagia and MOS workflow, achieving 100% for patient transfer form, 83% for nursing handover form and more than 70% for referral form in the September 2022 audit. As utensil recommendations were often difficult to remember and contributing to feeding errors, a separate utensil headboard was implemented in July 2021. This intervention increased the concurrence between prescribed utensils and utensils used to more than 85% in the March 2022 audit.

Staff may downgrade the diet or fluids while awaiting speech therapy review or during clinical deterioration, resulting in a mismatch between served and prescribed diet and fluid. This is documented as 'Not match but safer'. Clear documentation and proper assessment of those served less safe diet and fluid options are necessary to contextualise these choices and minimise adverse outcomes.

# **SUSTAINABILITY**

A follow up audit over 9 months showed and sustained reduced feeding related error of less than 15% in inpatient service. (Figure 4 & Figure 5)

# CONCLUSION

In conclusion, many stakeholders are involved in preventing feeding-related errors. Ongoing dysphagia education and reinforcement of workflows are important aspects to improve patient care and safety. Standardisation of processes has since been adopted as part of standard hospice workflow via 3 monthly audit and incident reporting.
